CultArm3D-Laser

Short Description

CultArm3D-Laser is an autonomous laser scanner that rapidly captures the shape of objects in three dimensions – even when encountering them for the first time. In contrast to traditional technologies, the scanner decides for itself how to view a particular item. Based on an initial scan, sophisticated algorithms determine what further scans are required. This enables CultArm3D-Laser to collect information on an unknown object quickly, with just a few scans – and without human intervention, prior training or an AD model. This degree of independence is unique, making the system ideal for deployment in manufacturing for mass customization.

Scanning is in real time, and can be performed at a variety of speeds and resolutions.

Applications

The CultArm3D Laser captures objects up to 20cm (adjustable) in 3D and color for industrial reconstruction purposes and quality assessment.

Specialty

- Fast geometry acquisition mode >150Hz for fast scanning
- Precise geometry acquisition to capture details for quality assessment
- Reduced scanning time and automated process flow
- High robustness against shiny materials and interfering ambient light
- Immediate visual feedback and 3D postprocessing of the model
- Mobility and quick setup through self-calibration

Technical Properties

Type

Coarse and fast 3D geometry

Targeted precise geometry and color imaging

Set-Up

1 mono camera for geometry

1 color camera for color imaging

1 line laser module

Measurement Volume

20 cm x 20 cm x 20 cm [length x width x height] (adjustable)

Resolution

400 μm depth in coarse scanning mode

50 μm depth in precise scanning mode

30 μm lateral resolution
